

PatientSupporter Change Log

Since PatientSupporter was drafted, several changes have been made as it has been developed. This document details the changes by date.

June 25, 2010 (changes up till June 25, 2010, the creation of this document)

- Removed CalendarID. This was originally used in WellnessRules which PatientSupporter was initially expanded off of. The requirement to share events is not required in the PatientSupporter. Any situation where CalendarID was used, ProfileID is now being used instead.
- Removed TimeZone from dateTime complex term. This is because, all facts containing representations in PatientSupporter would internally be in Standard Time. Ideally, on an EA level, the time would be converted into the user's preferred time (not yet implemented).
- Added Contact to the communication predicate. This allows profile users to associate their contact information to their listed communication channels.
- Removed Phone as an available channel. Information regarding phone is too personal and is a privacy risk. While conference calling phone numbers would have been a possible replacement for this, it does not meet the needed requirements of a channel because making initial contact would not be possible.
- Logically reordered the variables inside the myDiscussion as well the as the rule regarding the predicate. This groups similar rule and variables together, as well as places the rules that are most likely to fail first, for performance optimization.
- Capitalized all variable string values. This includes things such as category (In and Out), event tense (Possible, Planned, Past), etc.
